

- Wide Range of Supply Voltages
Single Supply...3V to 36V
or Dual Supplies
- Class AB Output Stage
- High-Impedance N-Channel-JFET
Input Stage... $10^{12}\Omega$ typical
- Internal Frequency Compensation

- Short-Circuit Protection
- Input Common-Mode Range Includes V_{CC-}
- Low Input Offset Current...50 pA typical
- Low Input Bias Current...200 pA typical

description

The TL091 JFET input operational amplifier family is similar in performance to the MC3403 family but with much higher input impedance derived from a FET Input Stage. The N-channel-JFET input stage allows a common-mode input voltage range that includes the negative supply voltage and offers a typical input impedance of 10^{12} ohms, a typical input offset current of 50 picoamperes, and a typical input bias current of 200 picoamperes. The TL091 family is designed to operate from a single supply over a range of 3 to 36 volts. Operation from split supplies is also possible provided the difference between the two supplies is 3 to 36 volts. Output voltage range is from V_{CC-} to 1.5 volts less than V_{CC+} with a load resistor to V_{CC-} .

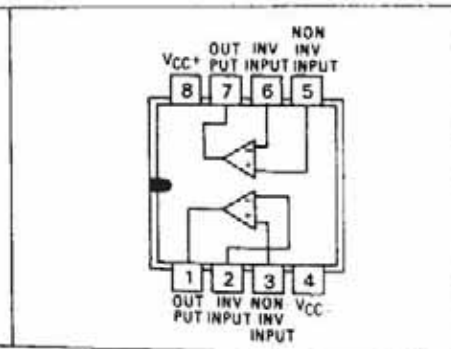

Device types with an "M" suffix are characterized for operation over the full military temperature range of -55°C to 125°C , those with an "I" suffix are characterized for operation from -25°C to 85°C , and those with a "C" suffix are characterized for operation from 0°C to 70°C .

Operating free-air temperature range	-55 to 125	40 to 85	-20 to 85	°C
Strong temperature range	-65 to 150	85 to 150	-65 to 150	°C
Lead temperature 1/16 inch (1.6mm) from case for 60seconds	J Package	300	300	°C
Lead temperature 1/16 inch (1.6mm) from case for 10seconds	N Package		260	°C

- NOTES: 1. These voltage values are with respect to the midpoint between V_{CC+} and V_{CC-} .
 2. Differential voltages are at the noninverting input terminal with respect to the inverting input terminal.
 3. Neither input must ever be more positive than V_{CC+} or more negative than V_{CC-} minus 0.3 V.
 4. For operation above 25°C free-air temperature, refer to Dissipation Derating Table. In the J package, TL094M chips are alloy-mounted; TL094I and TL094C chips are glass-mounted.

DISSIPATION DERATING TABLE

PACKAGE	POWER RATING	DERATING FACTOR	ABOVE T_A

†All characteristics are specified under open-loop conditions.

‡Input bias currents of a FET-input operational amplifier are normal junction reverse currents, which are temperature sensitive. Pulse techniques must be used that will maintain the junction temperature as close to the ambient temperature as is possible.

§The output will swing essentially to ground provided that load, R_L , is connected from output to ground.

PARAMETER	TEST CONDITIONS			MIN	TYP	MAX	UNIT
SR Slew rate at unity gain	$V_I = \pm 10V$, See Figure 1	$C_L = 100pF$,	$R_L = 2k\Omega$,	0.6			V/ μs

†All characteristics are specified under open-loop conditions unless otherwise noted. Full range for T_A is $-55^\circ C$ for TL091M, $-40^\circ C$ to $85^\circ C$ for TL091I, and $0^\circ C$ to $70^\circ C$ for TL091C.

‡The V_{ICR} limits are directly linked volt-for-volt to supply voltage, i.e., the positive limit is 3 volts less than V_{CC+} .

§Input bias currents of a FET-input operational amplifier are normal junction reverse currents, which are temperature sensitive. Pulse techniques must be used that will maintain the junction temperature as close to the ambient temperature as is possible.
